

## DESIGN ENGINEERING SERVICES

DSL has a comprehensive in-house Engineering resource covering a wide range of disciplines and work-scope, including Electrical, Mechanical and Structural Engineering, supported by the latest design software. We have permanent Engineering Teams in Great Yarmouth and Aberdeen that undertake work-scopes covering a broad spectrum of systems for power generation, mud systems, drilling structures and rig moving.

Rig Upgrades and Refurbishment Projects constantly provide our Engineering Teams with the challenges to improve operations or systems, and it is the exposure to such projects that constantly increases our experience and ability to provide effective solutions for improvements you may wish to implement on your rig.

Drilling Structures are of course part of our core business, and you will find a wealth of experience applicable to the design, modification, re-certification and validation of new and used Drilling Structures, both onshore and offshore. We are constantly upgrading existing Derricks, Masts and Substructures Worldwide for increased capacity, mobility and/or the introduction of new equipment such as racking systems etc.

For projects such as General Fabrication, we can either design your requirements in-house or provide additional support to your own Engineering Teams on an ad-hoc basis for Engineering and/or Draughting support.
